Stratux Radios (1090ES & UAT) Guide (v2+v3)
Last updated: 12/14/18

Thank you for purchasing the **Stratux 1090ES & UAT Radio** kit.

Each unit is tested in a Stratux unit before shipping it to you. There hopefully should not be any defects. See some of the guidelines below to make sure you get off to a good start. If it doesn't work out for you, please send an email to products@stratux.me.

1. To use the most recent UAT radio (Low Power v3, red colored), make sure to update to software **v1.5b1** or above.
2. Make sure that your Stratux unit gets **sufficient power**. Use one of the recommended battery packs from http://stratux.me. Use the power cord that comes with the recommended battery pack – it matters!
3. The SDRs are pre-programmed to match with tuned antennas. The frequencies are shown below. Make sure to connect the device to the matching antenna.
4. If you have issues after troubleshooting, send me an email at products@stratux.me for help!
5. If you've had a positive experience with this unit and Stratux, please post a review on Amazon. If not, please send me an email and we'll work it out.

Thank you for supporting The Stratux Project!
